## State-Level Variation in Children's Health Insurance: <br> A Deeper Look <br> A STATE-BY-STATE ANALYSIS

## Executive Summary

Although progress has been made toward reducing uninsurance among children, there are significant variations at both the state and national levels in children's health insurance coverage by age, race/ethnicity, and income.

The size of these differences in coverage varies by state. Several states with low rates of uninsurance for children have sizeable gaps in coverage by age, race/ ethnicity, and income. Conversely, some states that have high rates of uninsurance have relatively low gaps between these groups.
■ For example, Nevada has the highest uninsurance rate for children (21.0\%) but does not show much variation across age groups in the uninsurance rate. In contrast, Maine has a lower than average uninsurance rate for children (5.9\%), but has among the largest gaps in coverage across age groups
■ With regard to differences in uninsurance rates within states by race/ethnicity, several states with relatively low uninsurance rates for children have large gaps in insurance coverage by race/ethnicity - examples include Rhode Island, Minnesota, and Pennsylvania. In contrast, several high-uninsurance states have relatively low gaps by race/ethnicity (examples include Texas, Arizona, Florida, and Nevada).

- Although states like Massachusetts, Wisconsin, and lowa have among the lowest rates of uninsurance for children, they have fairly sizable gaps by income group; states with the smallest gaps by income include New Hampshire and Louisiana.
Even after controlling for factors that influence uninsurance rates, gaps in children's health insurance coverage by age, race/ethnicity, and income remain. In addition, the size of these gaps still varies substantially across states.

## Introduction

For more than a decade, significant effort has been put into reducing the number of American children who lack health insurance coverage. The passage of the State Children's Health Insurance Program (CHIP) in 1997 was perhaps the most important of these efforts, and it resulted in significant reductions in uninsurance among children. Between 1995 and 2008, the uninsurance rate for children fell from 12.6 percent to 9.1 percent; during the same period, the rate of uninsurance among non-elderly adults rose from 16.7 percent to 19.7 percent. ${ }^{1}$ This decline in the uninsurance rate for children occurred broadly across many states. ${ }^{2}$

This report takes advantage of a new source of data on health insurance coverage to examine patterns of children's health insurance coverage within states. Beginning with 2008, health insurance estimates are available from the U.S. Census Bureau's American Community Survey (ACS). As shown in Exhibit 1, the 2008 rate of uninsurance for children ranged from a low of 2.0 percent in Massachusetts to 21.0 percent in Nevada, with a national average of 9.9 percent.

Because of the large sample size of the ACS, these data can be used to analyze health insurance patterns within states at a much more detailed level than was previously possible. The purpose of this report is to analyze variations within states in children's health insurance coverage by age, race/ethnicity, and family income. This analysis provides a way to monitor progress toward increasing children's health insurance coverage at a more detailed level than the statewide measures of coverage that have historically been used as benchmarks.

## Findings

The analysis conducted for this report found significant variation in children's health insurance coverage within states, by age, race/ethnicity, and family income:

- Exhibit 2A presents state-level estimates of the distribution of health insurance coverage for children ages 0 to 5, 6 to 11, and 12 to 17. Although the percentage of children with private health insurance coverage increases with age, older children are also more likely to be uninsured.
- White children are much more likely than non-white or Hispanic children to have health insurance coverage, particularly private insurance coverage (see Exhibit 3A).
■ Low-income children continue to have high rates of uninsurance - nationally, 16.3 percent of children with family incomes at or below 138 percent of the poverty level and 15.0 percent of children with family incomes between 139 percent and 199 percent of poverty were uninsured in 2008, compared to 6.0 percent of children at or above 200 percent of poverty. Children in the lowest income group were about 2.7 times more likely to be uninsured than children with incomes at or above 200 percent of poverty (see Exhibit 4A).
Another way to think about these variations within states is in terms of the relative differences in coverage between different groups within a state. Exhibits 1 through 4E present analysis of the relative differences between groups by state.

[^0]shadac
位

Differences by age: Exhibits 2B through 2D present the results of our analysis of coverage patterns within states by age, along with detailed results in Exhibit 2E. Key findings from this analysis include the following:

- On average, children ages 6 to 11 are 14 percent more likely than younger children to be uninsured. The size of this gap is highest (56\%) in Maine; in contrast, Wyoming children ages 6 to 11 ages 40 percent less likely to be uninsured than their peers age 0 to 5 .
- Children ages 12 to 17 are 35 percent more likely to be uninsured than the youngest children. They are about 15 percent more likely to have private coverage, but only 63 percent as likely to have public coverage compared to the youngest children. This gap in the uninsurance rate between the oldest and youngest children is highest in the District of Columbia (158\%), while in North Dakota children ages 12 to 17 are 33 percent less likely to be uninsured.
- These gaps between age groups do not seem to have much relationship to a state's overall rate of uninsurance. For example, Nevada has the highest uninsurance rate for children (21.0\%), but does not show much variation across age groups in the uninsurance rate. In contrast, Maine has a lower than average uninsurance rate for children (5.9\%), but has among the largest gaps in coverage across age groups.
Differences by race/ethnicity: Exhibits 3B through 3D show the differences within states in health insurance coverage by race/ethnicity, with white children as the comparison group (detailed results are shown in Exhibit 3E). On average across the nation, non-white children are about 1.5 times more likely to be uninsured than white children, and Hispanic children are 2.8 times more likely than white children to be uninsured. Both groups are more likely than white children to have public coverage, but are much less likely to have private health insurance. Other key findings from this analysis include:
- For non-white children, the size of the gap in uninsurance is highest in North Dakota ( $710 \%$ ), while in Hawaii non-white children are 50 percent less likely to be uninsured than white children.
- For Hispanic children, the gap in uninsurance is highest in Tennessee (400\%); in contrast, Hispanic children in Montana were about 10 percent less likely to be uninsured than white children.
- Several states with relatively low uninsurance rates for children have large gaps in insurance coverage by race/ethnicity - examples include Rhode Island, Minnesota, and Pennsylvania. In contrast, several high-uninsurance states have relatively low gaps by race/ethnicity (examples include Texas, Arizona, Florida, and Nevada).

Differences by family income: Exhibits 4B through 4D illustrate differences in coverage for low income children compared to higher-income children, by state (detailed results are shown in Exhibit 4E). For the U.S. as a whole, the lowestincome children (at or below $138 \%$ of the poverty level) are 2.7 times more likely to be uninsured than children in families with income at or above 200 percent of poverty; these children are only one-fourth as likely as higher-income children to have private insurance coverage, and 7.4 times more likely to have public coverage. Children with slightly higher incomes (between $139 \%$ and $199 \%$ of poverty), are about 2.5 times more likely than higher-income children to be uninsured. They are 0.6 times as likely as higher-income children to have private health insurance, and 4.1 times as likely to have public coverage.

Other key findings from the analysis by family income include:

- The uninsurance gap between the lowest-income children and higher-income children ranges from 13 percent in New Hampshire to 380 percent in Nebraska.
- For children with incomes between 139 percent and 199 percent of poverty, the uninsurance gap ranges from 8 percent in Hawaii to 389 percent in South Dakota.
- Although states like Massachusetts, Wisconsin, and lowa have among the lowest rates of uninsurance for children, they have fairly sizable gaps by income group; states with the smallest gaps by income include New Hampshire and Louisiana.

## Discussion

This analysis takes advantage of the large sample size of the American Community Survey to examine differences in children's health insurance coverage patterns within states. The results of this analysis show that there is substantial variation within states, and the size of the differences varies widely across states.
These differences are likely influenced by a variety of factors. In order to control for variations in factors that are associated with the likelihood of having insurance coverage, we performed multivariate analyses that included employment status, industry, and education level of parents as well as age, race/ethnicity, and family income. In general, we found that even after controlling for these factors, significant gaps in insurance coverage remain and there are still substantial variations across states in the size of the insurance coverage gaps between groups. Additional multivariate analyses are ongoing, and we plan to publish more detailed results of these analyses at a later date.

Private Coverage includes employer sponsored, directly purchased, and military coverage; public coverage includes Medicare and any coverage from a government means-tested program.
People reporting both private and public coverage are counted as private and not public.
SE: standard error; SE of the ratio estimated using the delta method.
$95 \%$ Cl: $95 \%$ confidence interval around the ratio. Intervals crossing one indicate a non-signficant result.
Note: Ratios are not shown when the coefficient of variation is greater than .49.
Children are defined as 0-17 year olds.

Source: SHADAC analysis of 2008 American Community Survey Public Use Microdata Sample
Private Coverage includes employer sponsored, directly purchased, and military coverage; public coverage includes Medicare and any coverage from a government means-tested program.
Private Coverage includes employer sporsored, directly
People reporting both private and public coverage are counted as private and not public.
SE: standard error; SE of the ratio estimated using the delta method.
$95 \%$ CI: $95 \%$ confidence interval around the ratio. Intervals crossing one indicate a non-signficant result.
Note: Ratios are not shown when the coefficient of variation is greater than . 49 .
White and Non-white do not include people of Hispanic origin. Non-white includes African-American, Asian, American Indian, Pacific Islanders, and multiple race.
Hispanic includes people of all race groups.
Hispanic includes people of all race group
Children are defined as $0-17$ year olds.

Source: SHADAC analysis of 2008 American Community Survey Public Use Microdata Sample
Private Coverage includes employer sponsored, directly purchased, and military coverage; public coverage includes Medicare and any coverage from a government means-tested program.
People reporting both private and public coverage are counted as private and not public.
SE: standard error; SE of the ratio estimated using the delta method
$95 \%$ CI: $95 \%$ confidence interval around the ratio. Intervals crossing one indicate a non-signficant result.
Note: Ratios are not shown when the coefficient of variation is greater than . 49 .
Children are defined as 0-17 year olds.

## Methodology

In this report, we use data from the American Community Survey (ACS). The ACS is an annual survey conducted by the U.S. Census Bureau that includes questions on a wide range of topics, including demographics, income, employment, and health insurance (beginning in 2008). The ACS is a mixedmode survey that includes responses from mail, telephone, and in-person interviews. Nationally, about 4.5 million people respond to the ACS each year. The ACS collects data in every county in the nation, and its large sample size allows for the development of sub-state estimates. The data analysis for this report was performed with the ACS public use microdata sample, which includes nearly 700,000 children in 2008.
The ACS collects data on all sources of health insurance coverage that a person has at the time of the survey. For this report, SHADAC analyzed the ACS data on health insurance by primary source of insurance coverage. If multiple sources of coverage were reported for a child, any private coverage was considered primary over public sources of insurance such as Medicaid.
For the analysis by race/ethnicity, the "white" category includes people who described themselves as white alone and non-Hispanic; the "non-white" category includes non-Hispanic people who indicated any non-white race; and the "Hispanic" category includes all people who indicated that they were of Hispanic, Latino, or Spanish origin.

## About SHADAC

The State Health Access Data Assistance Center, or SHADAC, is an independent health policy research center located at the University of Minnesota School of Public Health. SHADAC is a resource for helping states collect and use data for health policy, with a particular focus on monitoring rates of health insurance coverage and understanding factors associated with uninsurance. SHADAC is funded by the Robert Wood Johnson Foundation. For more information, visit www.shadac.org.

## About the Robert Wood Johnson Foundation

The Robert Wood Johnson Foundation focuses on the pressing health and health care issues facing our country. As the nation's largest philanthropy devoted exclusively to improving the health and health care of all Americans, the Foundation works with a diverse group of organizations and individuals to identify solutions and achieve comprehensive, meaningful and timely change. For more than 35 years, the Foundation has brought experience, commitment, and a rigorous, balanced approach to the problems that affect the health and health care of those it serves. When it comes to helping Americans lead healthier lives and get the care they need, the Foundation expects to make a difference in your lifetime. For more information, visit www.rwjf.org.
